Title: Speaking Medicine in the Silent Language: An Experience with a Deaf Patient in Sri Lanka

Author names: Hettiarachchige Diluksha Prasad Jayawardana

Degrees: MBBS

Affiliations: The Faculty of Medicine, University of Colombo, 25 Kynsey Road, Colombo 08, Sri Lanka.

About the author: Hettiarachchige Diluksha Prasad Jayawardana is a medical graduate of the Faculty of Medicine, University of Colombo, Sri Lanka of a 5-year program. He was graduated in 2020.

Acknowledgment: I would like to thank Dr. Harsha Mendis for his guidance and support during the orthopedic surgery clinical clerkship.

Financing: The author has no financing for the study.

Conflict of interest statement by authors: The author has no funding, financial relationships, or conflicts of interest to disclose.

Compliance with ethical standards: Informed consent was taken at the time of interviewing the patient.

Authors Contribution Statement: Conceptualization: HDPJ. Resources: HDPJ. Writing – Original Draft: HDPJ. Writing – Review & Editing: HDPJ. Supervision: HDPJ. Project Administration: HDPJ.

Manuscript word count: 1100

Number of Figures and Tables: 0

Discussion Points

1. What is the present situation of using sign language in the medical service in Sri Lanka?
2. What are the challenges faced by health care personals & people with hearing impairment when seeking medical treatment concerning communication?
3. What are the opportunities to learn Sri Lankan sign language?
4. What is the most cost-effective way to bridge this communication gap for a developing nation?

Publisher’s Disclosure: This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our readers and authors we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final citable form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.
THE EXPERIENCE.

Among the differently able in society, most of the people with hearing impairment have a challenge for a very basic requirement of existence. It is verbal communication. To get through this barrier, many people in this group use sign language, which uses hand movements and body language to communicate. There are nearly 300 different versions of sign language among different communities worldwide. Even though, 9% of the total Sri Lankan population are deaf people, they use sign language with some regional variations. Despite having these slight variations, the fundamentals of sign language are the same everywhere. The need to use sign language varies from daily functions to public services like hospitals and other social gatherings.

Some months ago, I finished my orthopedic surgery appointment at the National Hospital of Sri Lanka. It was my first day of the orthopedic surgery appointment. As usual, I went to the ward in the morning. My patient was a 45-year-old Asian male. He had been admitted to the ward for corrective surgery of his leg length discrepancy following a road traffic accident. He had a terrible fracture to his left leg 4-years ago, which had been treated with a dynamic external fixator.

As usual, I started to interview the patient for history-taking. But he wasn't talking to me. Instead, he spoke with his hands which I could not understand. Then I realized that he was deaf. Therefore, I asked for an interpreter from the office. Unfortunately, there was no such service available in almost all hospitals in the country. Hospital staff communicated with the patient through one of his family members during the visiting hours. Therefore, I tried to communicate with him in a written language. Later, I realized that my strategy was not working. It didn't reveal the true story of the patient. So, I searched online to find a possible solution. "An Introduction to Sri Lankan Sign Language" by Rohana Special School was the best answer to help me with basic history-taking, performing a clinical examination, and discussing the plan of management up to some extent. Also, I had to rely on his family members for further clarification of several clinical details too. However, when I spoke to the patient with my hands, it was equally interesting, rewarding, and challenging.

During the interview which was conducted using sign language, he told me how the external fixator made his life terrible in the previous 4-years. Despite that, he further said that he had faced lots of communication difficulties with the health care personnel whether a nurse, doctor, or minor staff as they could not communicate with sign language. As the interview went on, I realized that there was no matter what the race or religion the deaf people belonged, they all faced similar problems in communication when seeking medical treatment in the government and private hospitals. However, he preferred government hospitals due to free health service and the trust he had on government institutions. During the course of his illness, he had been treated in an ayurvedic facility. But, there was neither a health care personnel nor an interpreter who knew sign language when providing health care. Since the sign language is more of an expression of ideas, he seemed to face difficulties in reading the grammatical application of written language in Sinhala.

After having a long talk with the doctors, nurses, and pharmacists in the ward, it was clear that they also faced difficulties with history taking, giving health education, and instructing on drug regime. Therefore, most of the time they communicate through a family member who doesn't have a hearing impairment throughout the hospital stay.
Despite being a small proportion of our community, they still require medical attention like the rest of the population. In Sri Lanka, there are several deaf schools, run by the government and local charity organizations. The deaf students are taught the general Sri Lankan public school curriculum ranging from Grade 1 to 11 in sign language. That education system is far different from the general education system. Unfortunately, there are no opportunities for the general public to learn sign language in their school curriculum. However, along the line, several steps have been suggested to overcome this barrier. Teaching lip reading with sign language for deaf children was one of those steps. Another step was to develop a software-based prototype to translate Sri Lankan Sign language into the Sinhala language to bridge the communication gap between deaf and non-deaf communities. Unfortunately, owing to the increased need for facilities, these have not yet made possible in Sri Lanka. The most recent approach was to develop a Sinhala-to-Sinhala Sign Language translation software for deaf children. This research project was carried out from 2014 to 2017 costing a sum of 2.5 million rupees. When considering the cost-effectiveness of operating such a system in each government hospital in Sri Lanka, the government will have to spend an added cost to annual health care expenditure of 206,182 million rupees. Therefore, implementing medical and nursing school curriculums necessarily to overcome this gap will be an effective way for a developing country like Sri Lanka. This can be achieved through lecture-based teaching preferably in the behavioral sciences stream, problem-based learning (PBL) with deaf patients, and encouraging elective experiences related to deaf culture.

Some weeks after, a colleague informed me of the patient's follow-up. He continued to have the same communication difficulty. At that moment, he had to rely on the patient's family too. According to him, he was not sure about the reliability of the true feelings of the patient when the communication was through close family members.

In conclusion, when a person with hearing impairment seeks medical care, communication plays a vital role to build a good doctor-patient relationship to provide a high-quality health care service. When considering the size of the Sri Lankan deaf population, there is a likely chance that we come across these people at some point in our careers. In that context, learning the basics of sign language to take a history and carry out basic clinical examinations followed by proper health education becomes very important to deliver health care effectively. For that purpose, teaching sign language through medical and nursing school curriculums is a cost-effective way to bridge this gap for a third world country like Sri Lanka. Every step in learning the basic skills and techniques of using sign language is challenging as it requires a lot of understanding, focus, and practice. The vocabulary gained can be reinforced by practicing each word separately and putting everything together in a synchronized way to form sentences and communicate effectively.
